Improving Your Soil, Particle by Particle

CarboMaxx contains humic and fulvic acids that play a vital role in building soil organic matter and the formation of soil particles. Natural bio-stimulants found in **CarboMaxx** increase nutrient availability in the soil, particularly phosphorus and micronutrients, supporting a wide variety of crops. **CarboMaxx**, especially in marginal soils, improves the soil's exchange ability, making it easier for nutrient uptake, resulting in faster growth and higher yields. It is completely water soluble in a wide range of pH values, 2-12. **CarboMaxx** is designed for direct field applications, injection into irrigation systems, or an addition to liquid starter fertilizer solutions.

- Improves nutrient and water holding capacity.
- Improves soil structure over time.
- Stimulates microbial growth.
- Readily bio-available.
- Improves nutrient absorption.
- Versatile potassium humate.
- Compatible with a wide-range of products.
- Assists in removing salts from soil.
