POWER K

The Preferred Source of Potassium for Plant Uptake

Power K is a superior potassium fertilizer. It is the most effective and efficient source of potassium available. **Power K** is a combination of an inorganic salt reacted with an organic acid to form a potassium acetate fertilizer and is the preferred source of potassium for plant uptake due to the acetate carrier

Potassium in Plants

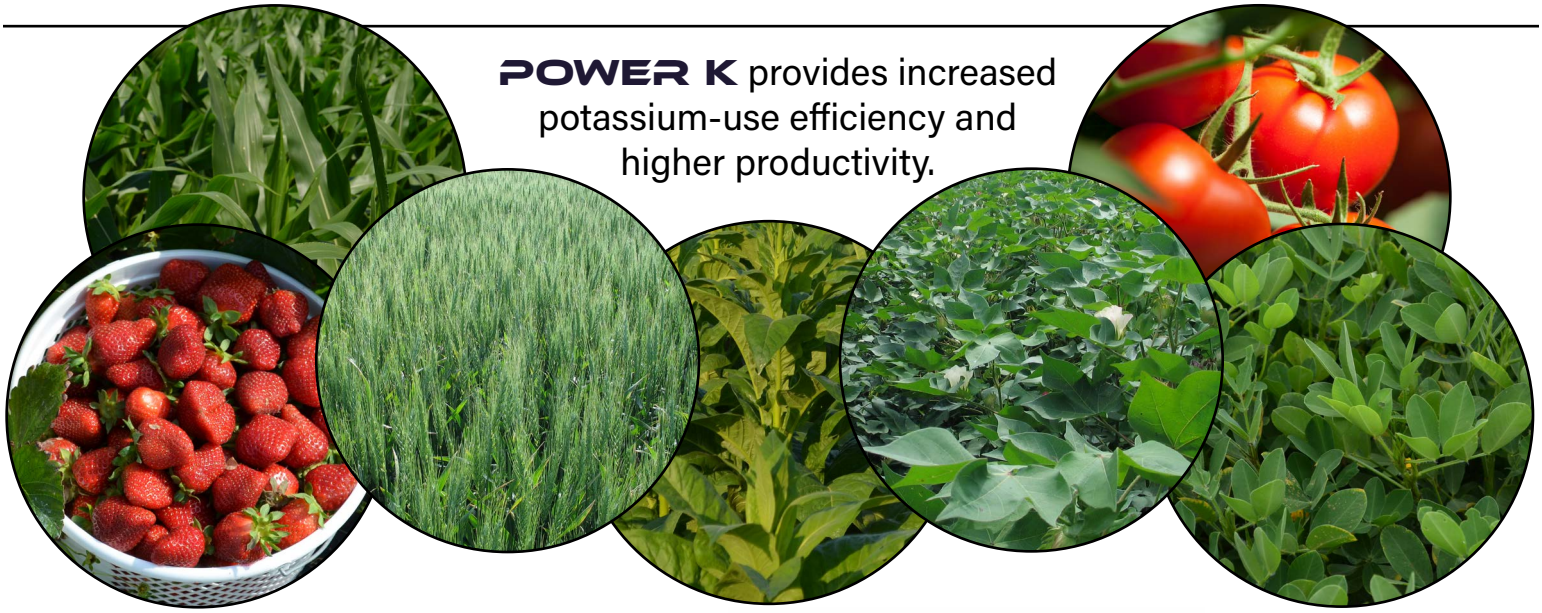

- Acts in the formation and translocation of starches, sugars, and fats.
- Regulates plant stomata to affect water use.
- Aids in enzyme activation
- Helps cells maintain internal pressure and ionic balance.
- Maintains balance of salts and water in cells.
- Maintains quality parameters such as size, shape, color, taste, and shelf life.

Features

- 0-0-24 Analysis
- Acetate form of potassium.
- Natural organic acid and plant metabolite.
- Chlorine-free, non-corrosive, and nonphytotoxic when used according to label directions.
- Superior potassium source compared to traditional potassium products.
- Potassium fertility and biostimulant in a single molecule.
- Very low salt index.

Benefits

- Safe for both foliar and in-furrow applications; will not burn.
- Quicker germination, improved root development, and an elevated abiotic stress tolerance.
- Better plant establishment, more vigorous growth, and higher yields.
- More efficient and readily absorbed by the plant.
- Provides plant with added energy derived from acetate.
- Suited for specialty crops where unique crop quality and plant health characteristics are important.
