IN-CROP DICAMBA APPLICATIONS

DRIFT-X Drift Reduction Technology & Pre-Vent VaporGrip Xtra Agent

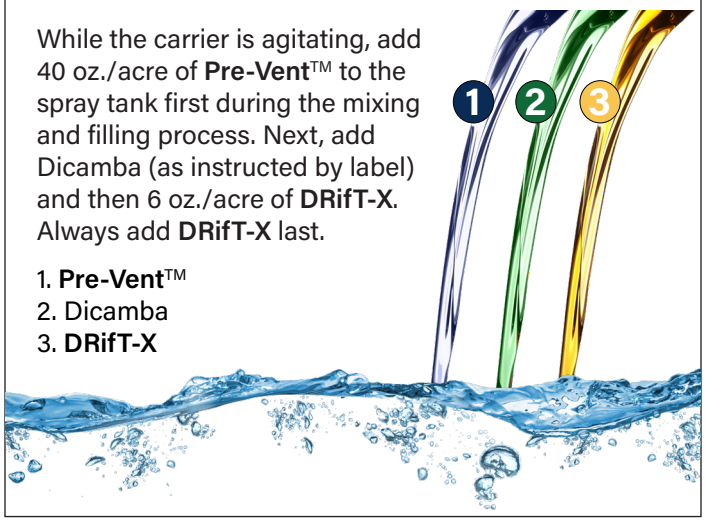

Pre-Vent™, a VaporGrip® Xtra agent, is required for in-crop dicamba applications. It may be used as an additional tool to reduce volatility potential when tank mixed with dicamba.*

DRifT-X, an oil emulsion DRA, is a deposition and drift management agent that reduces the number of spray droplet fines (<100 microns) and increases the VMD (Volume Median Diameter) of spray droplets. **DRifT-X** generates a more uniform droplet size spectrum, which results in enhanced deposition and coverage of the spray on the targeted surface. Since **Pre-Vent™** does not control drift, **DRifT-X** can be used to support in-crop dicamba applications.

Mixing order for dicamba applications

While the carrier is agitating, add 40 oz./acre of **Pre-Vent™** to the spray tank first during the mixing and filling process. Next, add Dicamba (as instructed by label) and then 6 oz./acre of **DRifT-X**. Always add **DRifT-X** last.

1. **Pre-Vent™**
2. Dicamba
3. **DRifT-X**

Always follow the precautions, restrictions, recommended use rates, and application directions appearing on the labels for each product to be tank mixed. **Pre-Vent™** and **DRifT-X** are approved for use with Stryax®, Engenia®, and Tavium®.**

*Use of **Pre-Vent™** does not replace an approved drift reduction adjuvant (DRA). **Pre-Vent™** is a volatility reducing agent but does NOT fully eliminate all volatility potential. Proper nozzle selection and operation (pressure and spray angle), good operator evaluation and decision - making on wind direction, temperature inversions, application speed, and susceptible crops in the area combined with **DRifT-X** are necessary for maximum drift reduction potential.

Use rate:

Pre-Vent: 40 oz./acre
DRifT-X: 6 oz./acre
