Attack Suckers from the Start with Ten Tac

TEN TAC is a carefully balanced combination of C-10 fatty alcohol and wetting agents used for the control of sucker growth on Burley, Flue-Cured, Dark, Maryland, and Cigar Tobacco. The concentrated product is diluted with water to form a creamy emulsion that is then applied as a course spray. The emulsion is effective only when it comes in direct contact with suckers; therefore, the material is applied so that maximum contact is made with the suckers.

- Premium emulsifier system.
- Proper balance of C-10 fatty alcohol for optimal performace.
- Easy to use: dilute and spray.
- Safe and effective.
- Leaves minimal residue.

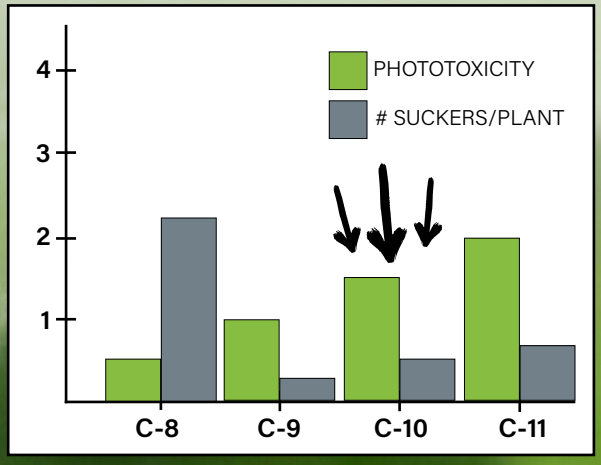

A proper sucker control program can ...

- Increase yield and body.
- Reduce the chance of plants blowing over, and the buildup of insects, eggs and larvae.
- Improve chemical and physical leaf properties.
- Stimulate root development and alkaloid production.

TEN-TAC '85' can be applied before or after topping. However, for best reults, spray before topping, in early-button stage (30%-40%), and then within a few days, removing any suckers that were missed.

ASK US ABOUT OUR FULL-SEASON SUCKER-CONTROL PROGRAM

Attack suckers at the start with C-10.

Studies show that the C-10 homolog is most effective for sucker control. It eliminates the bud and has low phototoxicity with virtually no residue.
