N-Put

Tap into Nature. More Nitrogen NOW!

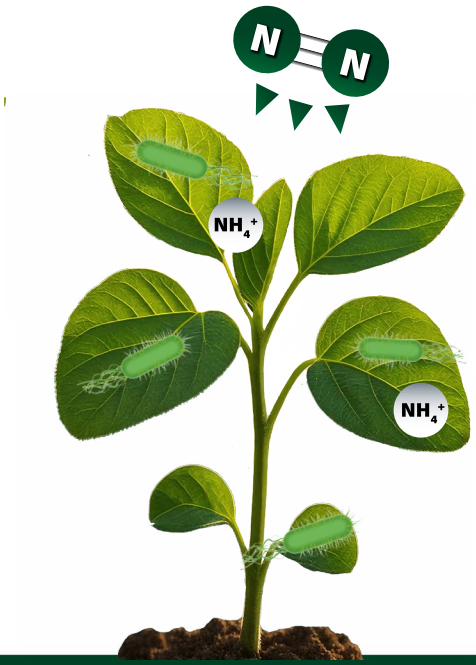

N-Put is a blend of two species of endophyte bacteria that, once applied, colonize and grow within the receptive plant. These bacteria convert atmospheric nitrogen, via air and soil, to a plant-available form of nitrogen, and also increase phosphorus mobilization within the plant.

These bacteria support nitrogen access regardless of – and in additon to – nuitrients available in the soil. By increasing access to nitrogen, **N-Put** extends nitrogen availabilty throughout the growing season – despite conditions – and supports your crops through times of stress.

EASY, FLEXIBLE APPLICATION

- Provides season-long nitrogen source.
- Increases yield potential, root development and stress tolerance.
- Can be applied via seed treatment, foliarly or in-furrow.
- Flexible foliar timing.
- Beneficial to all crops.
- Bacteria cause no harm to the plant.
- Low use rate - 16 oz. per acre.
- Compatible with most standard tank mixes.
